CAPABILITIES

Central Authority Fails IoT Trust

Current approaches concentrate control, latency, and breach risk

CAPABILITIES

DIDs Move Trust To Devices

Self-healing security layer uses decentralized identifiers (DIDs) and zero-knowledge proofs.

- Decentralized Identifiers (DIDs) anchor trust for each IoT device.
- Zero-knowledge proofs verify credentials without exposing raw data.
- Neural-Guardian consensus algorithm coordinates peer-to-peer attestation.
- Decentralized identifiers (DIDs) let devices prove identity without a central authority.
- Zero-knowledge proofs verify claims while keeping device secrets private.

CAPABILITIES

ZK Proofs Authenticate Without Exposure

Zero-knowledge proofs authenticate devices without exposing secrets or centralizing trust.

PITCH DECK

Sub-Millisecond Auth Fits Edge

Less than 1 ms authentication remains practical in low-bandwidth environments.

TRACTION

Edge Fleets Need Local Identity

Technical VCs and senior security architects need identity orchestration for bandwidth-constrained edge fleets.

4TN SPENDING

$1.

Links: Republicans' plan for zero state income tax could be 'devast

PITCH DECK

Capital Funds Proof And Pilots

Capital accelerates our first production pilots with industrial IoT clients

PITCH DECK

Autonomous Zero-Trust Identity for Edge Fleets

Investor pitch for technical VCs and senior security architects evaluating edge identity.

CAPABILITIES

ZK Proofs Authenticate Without Exposure

Step one: capture the minimum required identity signal

PITCH DECK

O(1) Scaling Avoids Bottlenecks

Constant-time O(1) scalability keeps verification work stable as device fleets expand.

CAPABILITIES

Hardware Roots Anchor Device Trust

Hardware-root-of-trust anchors DID keys before each edge session.

CAPABILITIES

Neural-Guardian Coordinates Edge Trust

Neural-Guardian consensus algorithm coordinates local trust state without a central authority.

CAPABILITIES

Usage Pricing Follows Device Fleets

Pricing should map to measurable customer usage

PITCH DECK

No Central Bottleneck Is The Moat

Central authority designs add latency, bandwidth dependence, and concentrated trust risk.

ROADMAP

Architect-Led GTM Starts At Edge

Start with technical buyers who own deployment risk

CAPABILITIES

Neural-Guardian Is Ready For Diligence

Diligence focus: O(1) verification, low-bandwidth operation, and Neural-Guardian consensus.
