

Central Authority Fails IoT Trust

Central authority creates a single control-plane failure for IoT devices and edge computing.

DIDs Move Trust To Devices

Self-healing security layer uses decentralized identifiers (DIDs) and zero-knowledge proofs.

— CAPABILITIES

Autonomous Zero-Trust Identity

Enabling sub-millisecond authentication for Edge Computing devices

\$0(1)\$ Scalability for cybersecurity

Hardware-Root-of-Trust Integration

Neural-Guardian Coordinates Edge Trust

Neural-Guardian consensus algorithm coordinates local trust state without a central authority.

NEURAL - GUARDIAN CONSENSUS ALGORITHM SHARES TRUST STATE ACROSS ED

Neural-Guardian consensus algorithm shares trust state across ed

LOCAL QUORUM DECISIONS REMOVE DEPENDENCE ON A CENTRAL AUTHORITY.

Local quorum decisions remove dependence on a central authority.

Edge Fleets Need Local Identity

Technical VCs and senior security architects need identity orchestration for bandwidth-constrained edge fleets.

No Central Bottleneck Is The Moat

Central authority designs add latency, bandwidth dependence, and concentrated trust risk.

Our Solution

Roadmap Scales Node To Fleet

— TEAM

Security Architects Need Execution Depth

Securing Edge Computing with Decentralized Identities

Product Roadmap for cybersecurity

Device-Fleet Pricing Needs Data

Financial projections should use founder-provided revenue and deployment data before investor use.

Capital Funds Proof And Pilots

Securing Edge Computing with Decentralized Identifiers

Autonomous Zero-Trust Identity for Edge Fleets

Investor pitch for technical VCs and senior security architects evaluating edge identity.

— CAPABILITIES

Neural-Guardian Is Ready For Diligence

Diligence focus: $O(1)$ verification, low-bandwidth operation, and Neural-Guardian consensus.
